

Development of training curriculum in sexual health for the postoperative breast cancer patients in China

WU Peipei

[Abstract] **Objective** To develop a training curriculum in sexual health for the postoperative breast cancer patients in China. **Methods** Delphi method was used in the study. Twenty experts in breast cancer nursing, sexuality, psychology were recruited in the study. The training curriculum was based on the two rounds of the consultation among 20 experts and needs of 100 postoperative breast cancer patients after the assessment. **Result** The training curriculum in sexual health for the postoperative breast cancer patients consisted of 4 dimensions, medicine, sexology, psychology and practice, which were divided into 52 teaching topics included in 19 courses. Experts and patients had the same opinions on the curriculum. **Conclusion** The training curriculum in sexual health for the postoperative breast cancer patients in China is scientific, practical and can be used as a guide for the clinical nurses to provide quality care for the breast cancer patients after the surgery. **[key words]** Breast Cancer; Sexual Health; Postoperative; Curriculum; Delphi Method
